sMDD (k = ceil(N/2), test: pareto_frontier) vs MDD — DD Python, paired rows (same instance, DD type, width and reduction)
MDD: results_python_01_11_2026_17-48-09.csv | sMDD: results_python_semi_semi_pareto_frontier_05_11_2026_20-35-34.csv
Columns are means over the paired rows; 'ratio' is the geometric mean of sMDD/MDD per row. Time = construction + reduction; Solve = longest/shortest path over the built diagram.
Bound means skip rows where either value is ±inf (empty restricted / unreachable terminal), counted in 'non-fin.'. 'sMDD +/=/-': rows where the sMDD bound is better / equal / worse.
